

Less setup. More **shared delight.**

A practical roadmap for a content-agnostic party platform that helps Hosts and audiences create the night together—without making either side learn the machinery.

10

DECISION SLIDES

6

CONNECTED WORKSTREAMS

1

OPERATING PRINCIPLE

We are not rebuilding the product. We are **making the primitives legible.**

Every slice must reduce mental workload without transferring confusion to another persona.

Host

KNOWS WHAT HAPPENS NEXT

Guest

KNOWS WHAT TO DO NOW

- 01 Content agnostic.** Karaoke is a use case—not the licensing-dependent definition of the platform.
- 02 Bounded slices.** One operator or audience outcome, measurable before deployment.
- 03 Progressive disclosure.** Live controls first; configuration depth when deliberately requested.
- 04 Proof over promise.** Automated gates, persona QA, production acceptance, and rollback paths.

Many sources and modes. One understandable room.

Outside world

YouTube Data + embeds
Apple MusicKit/API
Spotify discovery/handoff
Host uploads + local files

Stable contracts

Canonical song identity
Backing candidates
Provider capabilities
Room policy + economy

Orchestration

Queue + Run of Show
Lifecycle slots
Launch preflight
Ledger boundaries

Shared experience

Host control
Audience action
TV reveal
Recap + ranking

The architecture separates **identity**, **playback**, and **participation** so one provider outage or quota limit does not redefine the product.

- A Canonical songs** aggregate rankings regardless of which backing track was used.
- B Lifecycle slots** stop games and companions from silently replacing one another.
- C Server-owned spend** keeps premium value auditable and retry-safe.

Start with the **night guests will feel**—not the database fields behind it.

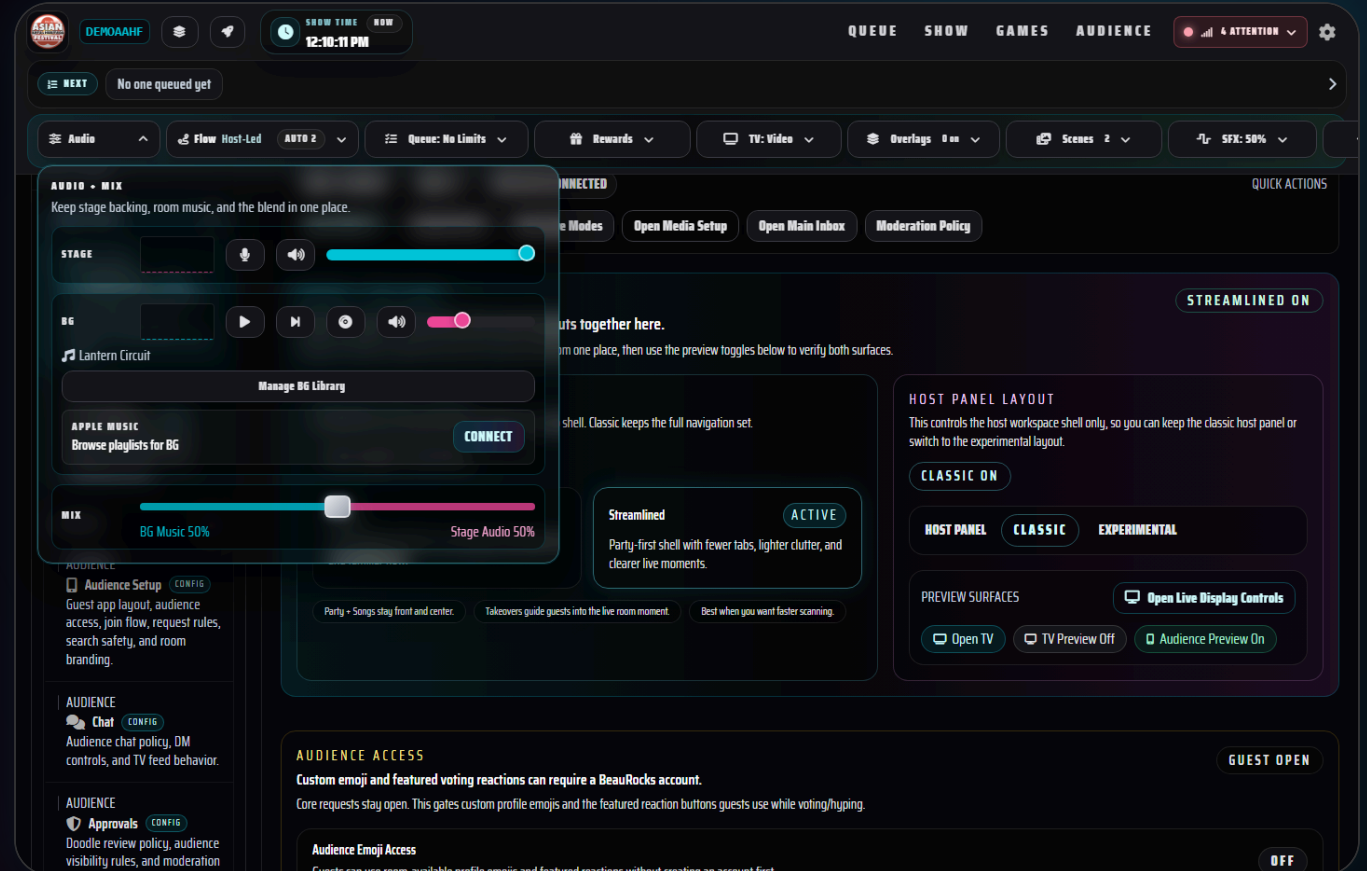

DOCUMENTED BASELINE

Room name, code, presets, economy, audience rules, modes, and provider details appeared as peer-level decisions. The screen introduced more questions than it resolved.

CURRENT DIRECTION

Operating style, crowd posture, access/economy, and launch readiness become the consequential choices. Advanced controls stay available without blocking launch.

Resolved: room name and code can be fully cleared and edited without the last character snapping back.

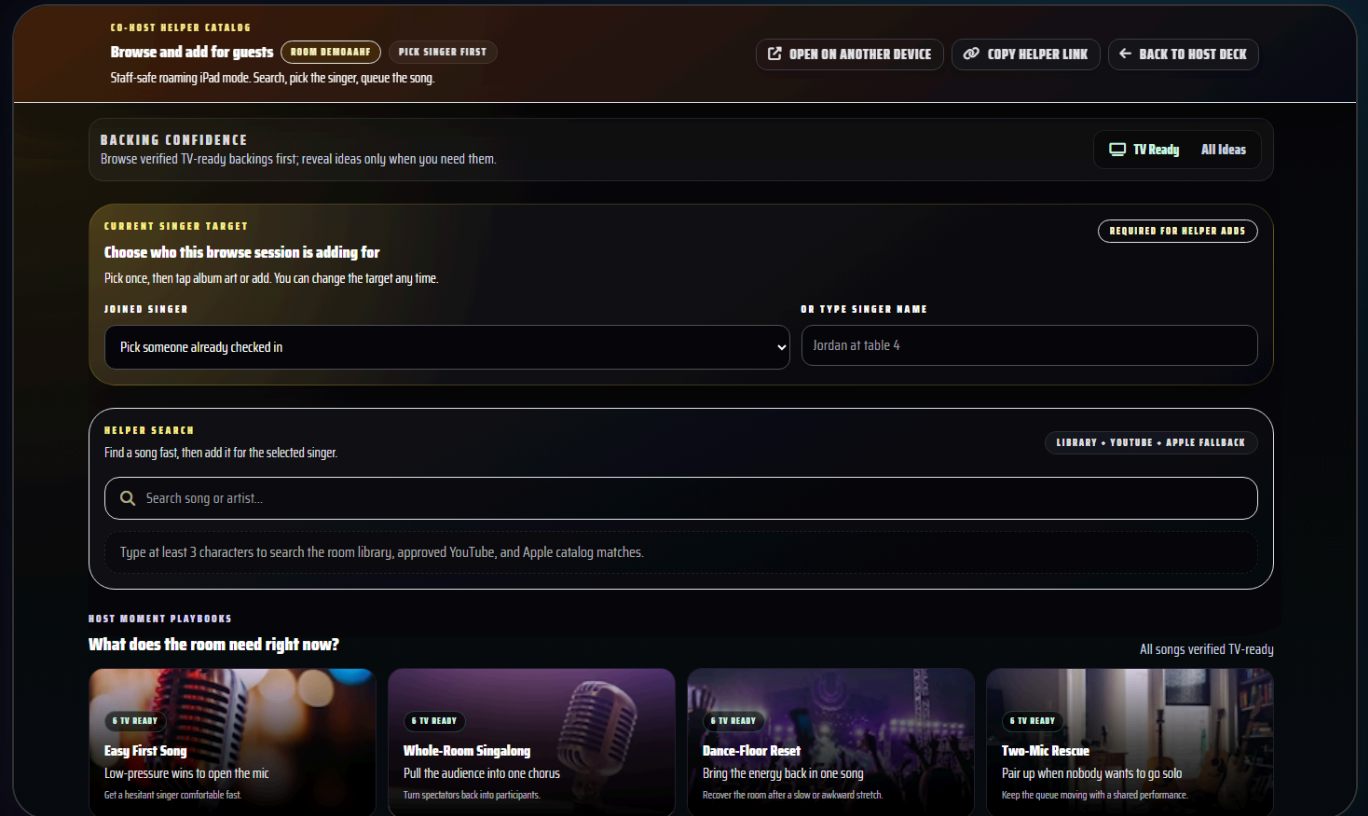

Verified current-state capture. No historical screenshot was fabricated; the “before” state is the documented baseline.

Browse the song once. Choose the **best playable backing**.

- 01 Navigation persists.** Diving into a category no longer strands the Host away from urgent panel tabs.
- 02 Album-forward discovery.** Art, themes, and trusted collections support browsing—not just text search.
- 03 One canonical identity.** Apple/iTunes metadata, ISRC when available, normalized title/artist, and provider links.
- 04 Many backing candidates.** Embeddability is mandatory; Host feedback, completions, and skips outweigh raw popularity.

Outcome: worldwide song rankings can aggregate across YouTube versions, known tracks, and future approved sources.

CO-HOST HELPER CATALOG
Browse and add for guests **ROOM DEMOART** **PICK SINGER FIRST**
Staff-safe roaming iPad mode. Search, pick the singer, queue the song.

[OPEN ON ANOTHER DEVICE](#) [COPY HELPER LINK](#) [BACK TO HOST DECK](#)

BACKING CONFIDENCE
Browse verified TV-ready backings first; reveal ideas only when you need them. [TV Ready](#) [All Ideas](#)

CURRENT SINGER TARGET
Choose who this browse session is adding for
Pick once, then tap album art or add. You can change the target any time. [REQUIRED FOR HELPER ADDS](#)

JOINED SINGER **OR TYPE SINGER NAME**

Pick someone already checked in ▼

HELPER SEARCH
Find a song fast, then add it for the selected singer. [LIBRARY](#) [YOUTUBE](#) [APPLE FALLBACK](#)

Type at least 3 characters to search the room library, approved YouTube, and Apple catalog matches.

HOST MOMENT PLAYBOOKS
What does the room need right now? All songs verified TV-ready

Easy First Song
Low-pressure wins to open the mic
Get a hesitant singer comfortable fast

Whole-Room Singalong
Pull the audience into one chorus
Turn spectators back into participants

Dance-Floor Reset
Bring the energy back in one song
Recover the room after a slow or awkward stretch

Two-Mic Rescue
Pair up when nobody wants to go solo
Keep the queue moving with a shared performance

Verified current-state capture, cropped at the album-forward discovery region.

A resilient catalog uses every source for the job it can legally and reliably perform.

YouTube

Embeddable stage media and karaoke backings. Reuse successful results for 72 hours, alias equivalent intents, verify playability, and index trusted playlists at low concurrency.

Apple Music

Host-owned library, background playlists, full-song fallback, and canonical metadata. Playback requires a connected MusicKit session.

Spotify

Discovery or external handoff only until playback, licensing, and capability policy support more. Never imply in-app playback that does not exist.

Uploads

Host-device background playback and content-agnostic fallback. "Playing" is reported only after the media element confirms it.

Reuse first.

THE YOUTUBE QUOTA STRATEGY

`search.list` is the expensive step. The compliant response is to reduce repeated live search, revalidate known IDs with lower-cost metadata calls, and request quota extension with evidence from real event demand—not scrape or bypass the API.

Large-event readiness: trusted backing reuse + canonical catalog + provider fallbacks + an evidence-backed YouTube quota-extension packet.

Separate participation status from spendable event value.

Points

Reputation, participation, rankings, and recognition.

- Earned through play and engagement
- Not represented as cash value
- Supports recurring identity across nights

BeauBucks

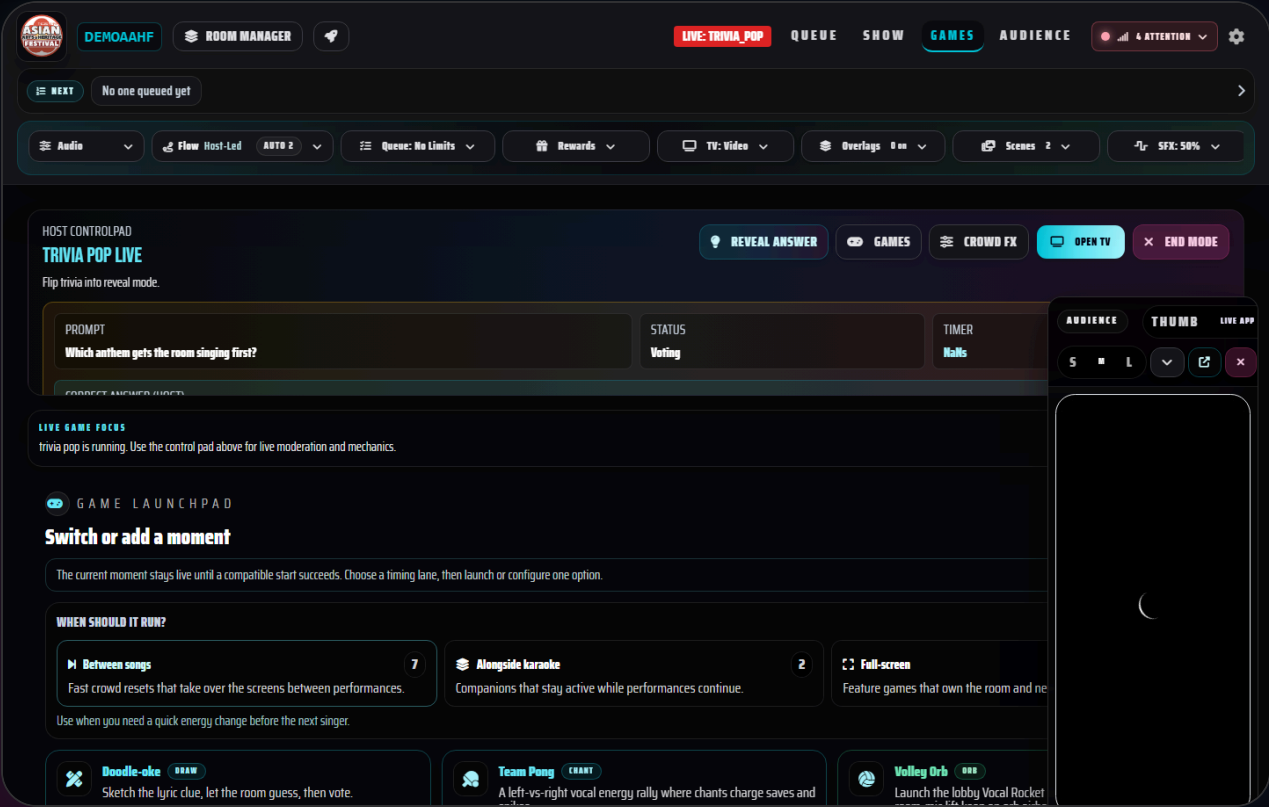

Premium or event-funded value used for deliberate room actions.

- Can be included with paid admission
- Can support performer-directed contribution intent
- Server-priced, operation-ID protected, and auditable

Flexible policy, fixed clarity: a free-flowing house night and a \$20 ticketed fundraiser can use the same primitives without making the currencies mean different things.

- ✓ Canary spends are atomic, retry-safe, and paired with typed shadow ledger entries.
- Legacy room points remain balance authority until reconciliation and opening-balance gates are explicitly satisfied.

When a moment is live, the Host sees **the next useful decision**—not every setup primitive.

3

TIMING CHOICES

2

ACTIONS TO RECOVER CONTROLS

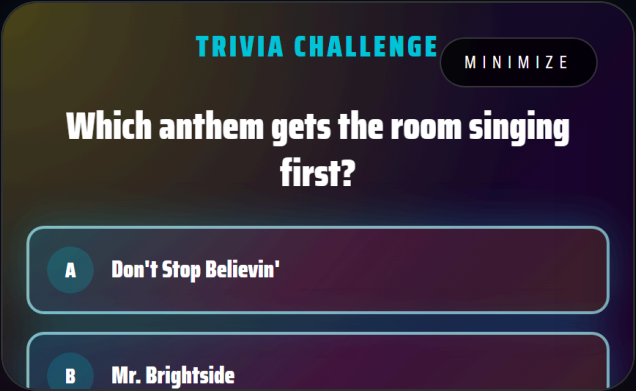

≤ 2

BUTTONS PER COMPACT CARD

Trivia blocked Bingo. Bingo blocked WYR. Both live modes stayed intact.

Verified compact Live Switcher capture. The live controlpad remains primary; configuration depth is still one deliberate action away.

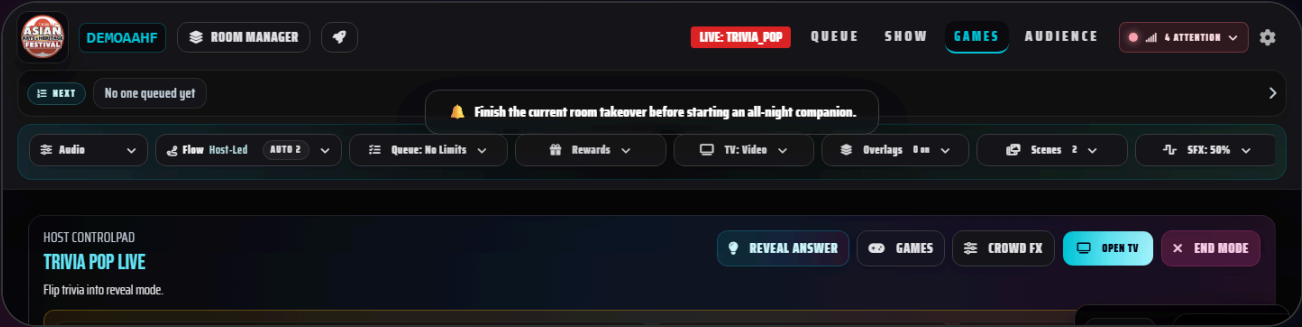

The proof spans **Host**, **audience**, and **TV**—not just component tests.

Audience action contract

TV prompt + reveal ownership

Blocked launch retains current live state and explains recovery.

Keep shipping the plan. Measure the outcome, then earn the next slice.

NOW · EVIDENCE

Decision artifact

Package the verified room, catalog, provider, economy, and game work into one executive narrative and stakeholder scorecard.

- ✓ 10 slides, evidence-linked, no invented “before” screenshots

NEXT · RELIABILITY

Event readiness

Close real-device Apple/background recovery, curated catalog operations, and the YouTube quota-extension submission packet.

- ✓ Successful fallback and recovery during a production-style event drill

THEN · CONVERGENCE

Policy + comprehension

Measure new-Host room launch, expand safe BeauBucks canary coverage, and test guest understanding of Points versus spendable value.

- ✓ No authority migration until reconciliation gates pass

Success is not “more features.” It is a Host who can run the room while the audience understands how to join, act, spend, and delight one another.

CTO Contracts, quota, observability, rollback, migration safety.

CPO Fewer decisions, coherent primitives, adoption, recovery.

CMO Content-agnostic promise, capability truth, theatrical BeauRocks energy.
